

Changes Consistent with Epidermal Nevus

Notes

- Epidermal nevi may resemble seborrheic keratosis or resolving verruca vulgaris
- Clinical pathologic correlation is recommended

A histological section of skin stained with hematoxylin and eosin (H&E). The epidermis is thickened (hyperplasia) and shows a wavy, papillomatous border. The dermis is composed of dense, pink-stained collagen fibers. There are no viral cytopathic changes visible in the epidermal cells.

No viral cytopathic changes

Epidermal hyperplasia with papillomatosis

May lack distinct rete ridge flattening or horn pseudocysts
